

ABSTRACT
IMPROVEMENTS IN OR RELATING TO BEVERAGE DISPENSE

- 5 A beverage dispense system has a dispense nozzle with inlet sections for
connection to beverage supplies that merge into an outlet section sized to
match the flows such that a unit volume of beverage can be dispensed more
quickly. The inlet sections are provided with separate valves controlling
the flow so that beverage can be dispensed through either one or both inlet
10 sections. The nozzle is automatically drained on completion of a dispense
by air admitted to the nozzle via a passageway.
